

I think the NAB is acting like a bunch of children. Of course, any time they get a chance to tread on competition through the legal ground, they WILL do it, they always have and always will. Satellite radio is a threat to the bottom line to the NAB, so they are going to do anything they can to stop them before it's too late. If you think what the NAB is doing is right, then think of the fact that just a few years ago the government required satellite TV companies to put local programming in it's satellite stream. The telcom act of 96 also protects competition, specifically between cable media and satellite media. So what is the difference? Why is it required with TV but illegal with radio? Does anyone have a good valid argument as to why this is happening? Of course not. XM is a company that offers a better product at a fair price. What is the logic behind this?
